

Thank you for buying a widget from ecommerce-extensions.com! In this document you will find all necessary instructions on how to install, use and modify your widget to fit your store's needs.

Remember that you get free upgrades of this widget up to three months after you bought it, so if Varien add some functionality which makes the widget not work within that period we will integrate it to the widget (normally within a few weeks) so that you can upgrade your store to the latest version of Magento.

Template-name	Offer Widget
Document last updated	04.09.2008
Template last updated	04.09.2008

Installation

Ok, the whole installation should take around 5-15 minutes based on how well you know Magento.

1. First, open up the ZIP-file and copy everything into a new folder called "offerwidget" inside your skin-area", for example: /skin/frontend/default/<your_template>/offerwidet.
2. Next, open up the following file in your template-area:

/app/design/frontend/default/<your_template>/template/page/html/head.phtml

There put in the following code if it doesnt already load the swfobject.js-file somewhere else:

```
<!-- START EE-widgets -->
<script type="text/javascript" src="<?=$this->helper('core/js')-
>getJsSkinUrl('')?>newswidget/swfobject.js"></script>
<!-- END EE-widgets -->
```

3. Now log in to your Magento Admin-pages and go to "CMS" and "Static blocks". Add a new block called for example "Frontpage Widget" and type in identifier "frontpage_widget". Choose StoreView (or all), then choose Enabled and last copy the following code into the Content-area:

```
<style type="text/css">
    .offerwidget_container {
        background-color: white;
        width: 940px;
    }
</style>

<div class="offerwidget_container">
    <div id="offerwidget1">
        <p>This slideshow requires <a href="http://www.adobe.com/go/getflashplayer">Adobe
Flash Player 9.0</a> (or higher). JavaScript must be enabled.</p>
    </div>
</div>

<script type="text/javascript">
    swfobject.embedSWF("/skin/frontend/default/<your_template>/offerwidget/OfferWidget.swf",
"offerwidget1", "940", "450", "9.0.0", false,
{xmlfile:"/skin/frontend/default/<your_template>/offerwidget/config_frontpage.xml",
loaderColor:"0x666666"}, {bgcolor: "#FFFFFF"});
</script>
```

4. Ok, now you must edit the config_frontpage.xml-file to fit your needs. Remember that you can have as many XML config-files (and then as many widgets) as you'd like on your store. The XML config-file should be pretty self-explainable, just remember to fit the sizes (width) on both the Static block and the XML config-file!
5. To use the config_frontpage.xml-file in a 940px width frontpage (standard "1column"-size on most of our templates) just insert the following code into the "CMS" -> "home"-page:

```
{{block type="cms/block" block_id="frontpage_widget" template="cms/content.phtml"}}
```

6. You're done!

If you want to use the widget in a static block inside for example a product-category instead just use the config.xml example file and create a new Static block called for example "Phones Widget", and add the same code there, but just reduce the width to 715px (for "2columns-left").

Next go to the category in the Admin-pages and choose the static block you want to be displayed above the products.

There are many many ways of using the widget so feel free to explore the possibilities.

We have developed the widget 100% for Magento and our templates but if you get into any large problems with the widget dont hesitate to contact us at support@ecommerce-extensions.com at any time. Just remember to give as much details as possible and try a few more things than you normally would before you contact us.

Thank you for choosing Ecommerce-Extensions.com! Stay tuned for new Magento-widgets and great extensions and templates for your Magento-store on ecommerce-extensions.com every month!
